

JOVANY RAAFAT WAHBA

SYSTEMS & SOFTWARE ENGINEER

Cairo, Egypt · +20 100 822 5833 · jovywahba@gmail.com · linkedin.com/in/jovany-wahba · github.com/jovywahba

SUMMARY

Systems & Software Engineer with a B.Sc. in Computer Science from Nile University and specialised training from the ITI Frontend & Mobile Platform track. I build and operate complete software systems rather than interfaces alone — application front ends, REST APIs and server-side business logic, relational data models, authentication and user roles, third-party integrations, and production deployment on real domains. Recent work spans an internal production booking and operations platform, its public customer-facing counterpart, bilingual clinic management software and two SaaS products, all live in production, built with Next.js, React, Node-based server logic and PostgreSQL via Supabase, and shipped on Vercel and Cloudflare.

SELECTED ENGINEERING PROJECTS

TPP Studios — Internal Production Booking & Operations Platform

studios.tpp.network

Full-Stack Software Engineering

- Engineered a full-stack studio booking and operations platform replacing a manual process: a multi-step flow that assembles a booking dynamically from date and time, guests, studio, equipment and crew, services and delivery requirements, priced by a configurable rules engine covering duration, preparation time, overtime rounding and deposit percentages.
- Built the backend and data layer on Supabase and PostgreSQL, making studios, equipment, extras, talent rooms, post-production packages and pricing configurable as data rather than code, with role-based administration over users, resources, promo codes, booking configuration and booking lifecycle states.
- Integrated the supporting workflows — Google Calendar for scheduling and availability, transactional email for booking and operational notifications, authentication with role-aware permissions, and deployment on Vercel.

Stack: Next.js · React · Node.js · REST API · Supabase · PostgreSQL · Auth & RBAC · Google Calendar API · Resend · Paymob · Vercel

The Studio — Public Studio Booking Platform

the-studio.me

Full-Stack Software Engineering

- Built the public-facing side of the same booking platform, letting external clients configure a studio session — time, studio, equipment, crew, services and file-delivery options — through a dynamic booking journey with an itemised, rule-based price.
- Implemented the customer-facing commercial logic: duration-tier pricing and discounts, conditional security deposits for bring-your-own equipment or crew, VAT-inclusive totals and server-validated promo codes, with catalogue and pricing kept centrally configurable.
- Integrated authentication with identity-based routing that separates staff and customer experiences across hosts, customer booking management, calendar-backed availability, transactional email and Paymob checkout — preserving a customer's in-progress booking across sign-in.

Stack: Next.js · React · Node.js · REST API · Supabase · PostgreSQL · Supabase Auth · Google Calendar API · Resend · Paymob · Vercel

TPP Group — Corporate Media Platform

tppgroup.co

Full-Stack Software Engineering

- Built the production corporate platform for a media group, presenting its business units, brand portfolio, leadership and editorial content as one routed React application on a reusable component and layout system shared across corporate, brand and editorial sections.
- Implemented the Supabase data layer: editorial posts served from PostgreSQL and filtered by type and publication status, newsletter signup routed through a database function rather than a client-side table write, a confirmation email sent from an Edge Function, and an authenticated admin area — behind a route guard and an allowlist check — for publishing and sending newsletters.

Stack: React · Vite · Supabase · PostgreSQL · PostgREST · Supabase Edge Functions · Supabase Auth · Cloudflare

TPP Intelligence — Arabic Audience Intelligence Platform

tppintelligence.io

Full-Stack Software Engineering

- Built a multi-tenant analytics platform connecting social, ad and podcast accounts through 15 OAuth integrations, normalised by scheduled Python pipelines into one PostgreSQL warehouse with row-level security enforcing tenant isolation in the database.
- Engineered the product layer: a modular dashboard of custom SVG charts, a reporting engine rendering charts server-side into scheduled PDF and spreadsheet deliverables, transcript semantic search over vector embeddings, and a natural-language analysis layer grounded in the platform's own data via the Anthropic API.
- Delivered bilingually (English/Arabic, full RTL) with role-aware access, audit logging, admin sync-health tooling, and 27 scheduled workflows covering watchdogs, backfills, backups and migration rollback.

Stack: Next.js · React · TypeScript · Python · Supabase · PostgreSQL · RLS · OAuth 2.0 · Anthropic API · OpenAI Embeddings · GitHub Actions · Vercel

ClinicPro — Clinic Management SaaS

clinicpro.me

Full-Stack Software Engineering

- Built a bilingual (Arabic/English, RTL) multi-tenant clinic-management SaaS covering appointments, the daily patient queue, medical records, prescriptions and investigation orders, clinic-branded printable documents and income tracking — with each

clinic's data isolated by PostgreSQL row-level security rather than application-layer filtering.

- Engineered the platform layer: middleware route protection backed by client role guards, a super-admin tier for managing clinics and users, subscription plan gating with Paymob payment-intention creation and HMAC-verified webhooks, realtime team chat, spreadsheet export, and 19 sequenced migrations including three production-hardening passes.

Stack: Next.js · React · TypeScript · Supabase · PostgreSQL · RLS · Supabase Auth/Storage/Realtime · Paymob · PostHog · Vercel

The Vow — Digital Invitation Platform

thevow.life

Full-Stack Software Engineering

- Built a digital invitation and guest-management platform on a host → event → guest model, where each guest receives a private tokenised link that renders one invitation personalised to them and captures their RSVP without an account — resolved server-side through token-keyed database functions, with row-level security separating public invitation reads from host-only data.
- Engineered a single rendering engine driving 28 invitation templates with data-driven colour themes and font pairings, plus the host dashboard, RSVP and open-tracking, Supabase Auth and Storage, transactional email via Resend, and a platform admin tier.

Stack: Next.js · React · TypeScript · Supabase · PostgreSQL · RLS · Supabase Auth/Storage · Resend · Vercel

The QR Gate — QR Code SaaS

theqrgate.com

Full-Stack Software Engineering

- Built a freemium QR-code SaaS supporting 16 QR types across static codes (payload encoded directly) and dynamic codes that resolve through a managed short link — so a printed code's destination can be changed after printing while the QR image stays the same, with the redirect locked to a stored, pre-validated URL and scan analytics recorded off the redirect path.
- Engineered the platform around it: a registry-driven QR engine with PNG/SVG export, editable hosted mobile landing pages, per-owner row-level security, version history and scan analytics, Stripe subscription gating with a signature-verified webhook, storage uploads, and a platform admin tier.

Stack: Next.js · React · TypeScript · Supabase · PostgreSQL · RLS · Stripe · qr-code-styling · Vercel

EXPERIENCE

Cred Development — IT Department Intern

Cairo · Dec 2024 – Jan 2025

- Maintained accurate digital records across users, emails, purchases and bills, and supported data consistency across internal systems.

General Petroleum Company — Intern

Cairo · Aug 2023 – Sep 2023

- Observed cross-department operations and IT systems integration, gaining exposure to data handling in large infrastructures.

TECHNICAL SKILLS

Languages & Frameworks: TypeScript, JavaScript, Python, Next.js, React, Node.js, Express, React Native, Flutter, Dart, HTML5, CSS3, Tailwind CSS, Vite

Backend & APIs: REST API design, server-side business logic, pricing and booking rules engines, OAuth 2.0 integrations, scheduled data pipelines, authentication and role-based access control

Databases & Data: PostgreSQL, Supabase, PostgREST, Firebase, MongoDB, relational schema design, row-level security, data normalisation and warehousing, reporting and export

Infrastructure & DevOps: Vercel, Cloudflare, GitHub Actions, CI/CD, scheduled jobs and watchdogs, database backup and migration rollback, domain and DNS configuration, Git

AI & Integrations: Anthropic API, OpenAI embeddings and semantic search, Google Calendar API, payment gateway integration (Paymob), transactional email, analytics instrumentation

Practices: Arabic/English bilingual and RTL interfaces, responsive UI, automated testing (Vitest, Playwright), accessibility checks, audit logging, technical documentation

EDUCATION

B.Sc. in Computer Science

Nile University — Giza, Egypt

Grade: Good

Graduation project: Recipe Recommendation System (mobile app)

TRAINING & CERTIFICATION

Information Technology Institute (ITI)

Frontend & Mobile Platform Track

Intensive course: JavaScript, React, React Native, Flutter, Firebase, testing, UX for mobile, networking fundamentals.

IBM SkillsBuild

Web Development Fundamentals

Credential available on request.

EARLIER PROJECTS

University, ITI and team projects — Enjez services booking platform (web and React Native mobile), React e-learning SPA, e-commerce web and mobile apps, movie app, and a Node/Express social app. Full write-ups at github.com/jovywahba.
